

Singapore Management University School of Information Systems

At SMU School of Information Systems (SIS), our teaching and educational projects focus on designing and using information systems in the context of business and industry settings. Students learn how to create IT-enabled solutions that enhance business innovation and agility, and improve organisational performance. They learn how to work with 'application building blocks', and how to integrate these system building blocks into larger scale enterprise business solutions that enable or improve critical business capabilities.

Due to the way we teach IT in the context of business and industry scenarios, students learn as much about the design and operation of business systems as they do about IT systems. They are also trained to understand and deal with the economic, managerial and strategic aspects of designing, implementing and using information technology.

Our BSc (IS Management) students are sought after by the industry for their ability to deal with complex challenges involving both Information Technology and Business Performance Improvement. Due to the extensive number of projects completed during the degree programme, BSc (ISM) graduates are honed to be highly effective collaborators and project managers. They are also known for their ability to 'learn-how-to-learn' in order to deal with rapid changes in technology as well as in the business setting.
